RESEARCH PAPER 06/09
13 FEBRUARY 2006

## Inflation: the value of the pound 1750-2005

The Library is often asked how the purchasing power of the pound has changed over various periods.

This paper presents data back to 1750. Between 1750 and 2005, prices increased nearly 150 -fold. Since 1914, prices have increased 77 -fold.

This paper updates RP03/82.

Dominic Webb

Library Research Papers are compiled for the benefit of Members of Parliament and their personal staff. Authors are available to discuss the contents of these papers with Members and their staff but cannot advise members of the general public. Any comments on Research Papers should be sent to the Research Publications Officer, Room 407, 1 Derby Gate, London, SW1A 2DG or e-mailed to PAPERS@parliament.uk

## Summary of main points

- This paper presents a price index covering the period 1750 to 2005 , illustrating the way in which the purchasing power of the pound has changed over the long-term.
- Over the period as a whole, prices have increased nearly 150 -fold. Thus, one decimal penny in 1750 would have had greater purchasing power than a pound in 2005.
- Prices were around $20 \%$ lower in 1939 compared to 1919.
- Since 1945 prices have risen in every year. In 2005, prices were nearly 30 times higher than 1945.

## I Introduction

Inflation - the increase in the general level of prices over a specified period - reduces the internal value of a currency. So, if prices double, any given (nominal) amount of currency will buy half the goods and services it previously did. On the other hand (although unusual in the UK since the Second World War) a period of falling prices results in an increase in purchasing power.

This paper presents a price index covering the period 1750 to 2005 and illustrates the changing purchasing power of the pound over the long-term. No attempt is made to measure changes in the external value of the currency as a result of movements in exchange rates, but changes in the prices of imported goods are reflected in the price index.

It must be stressed that, for a number of reasons, such an exercise is very approximate. Expenditure patterns have changed dramatically over the past 250 years. Many products now commonly purchased (cars, electrical appliances, processed foods, etc) simply did not exist in 1750 and, conversely, goods that consumed a large share of household budgets in the eighteenth century - candles for instance - are now an insignificant part of most families' expenditure.

It is, however, possible to compare price levels over the long-term by linking price indices covering relatively short periods into a single series. Even so, indices covering only a few years can become unrepresentative if they are not adjusted to reflect changes in expenditure patterns. Today's Retail Prices Index (RPI), for example, is annually updated to reflect changes in consumers' tastes, and new products and services. For example, pre-recorded cassette albums were taken out of the 2002 'RPI basket' of representative goods and services, while DVD players and recordable CDs came in.

A further problem with long-term comparisons involves changes in the quality of goods. For example, while it is possible to compare the price of a Mini motor car today with that of one in 1959, it is much more difficult to identify the degree that the increase in price reflects an improvement in manufacturing quality and specification.

In addition, the further one looks back into history, the more difficult it is to obtain reliable information. The first official consumer price index started in 1914. This was the Cost of Living Index (COLI) that reflected changes in the cost of providing a standard of living prevalent in working class households. There are also periods for which a number of alternative indices are available that can suggest different trends in price levels. Therefore, although the index given in this paper is presented in unrounded form to facilitate computation and presentation, it is not necessarily accurate to the degree suggested.

This paper includes only the new price index, agreed between the Office for National Statistics (ONS), Bank of England and the Library, which was first presented in the previous edition of this paper (RP03/82). Prior to that, the index had been calculated on a slightly different basis. For details of the old index, please see RP03/82.

## II Sources

Information on changes in prices comes from two main types of source. The more familiar are consumer price indices such as the RPI. ${ }^{1}$ An alternative measure can be derived from estimates of household expenditure in the national accounts statistics; a price deflator for household expenditure can be calculated as expenditure data are produced at both current and constant prices. The price index presented in this paper is derived from the following sources. Further details of source materials are available from the Library:

## 1947 to 2005

The all-items RPI as published by the Office for National Statistics. (The all-items RPI includes mortgage interest payments.) Annual data are the average of monthly figures. ${ }^{2}$

## 1870 to 1947

The implied deflator for consumers' expenditure derived from the unofficial national accounts of the UK based on the structure of expenditure in 1938 and produced by the Department of Applied Economics at Cambridge University. ${ }^{3}$

## 1850 to 1870

A retail price index constructed by Sir Walter Layton and Geoffrey Crowther covering the period 1850 to 1933. The index for the period 1850 to 1870 is a reproduction of earlier work by G H Wood from the Board of Trade's Report on Wholesale and Retail Prices and Cooperative Society records. ${ }^{4}$

## 1750 to 1850

An index of consumables' prices constructed by E H Phelps-Brown and Sheila Hopkins covering the period 1264 to 1954 . $^{5}$

## III Results and interpretation of tables

Table 1 (pages 12-17)
The first column shows the price index, based on January $1974=100 .{ }^{6}$ The second column (purchasing power of the pound) shows how much a pound is worth in real terms each year from 1750 to 2005, relative to January 1974. For example, between January 1974 and 1978, prices increased by $97.1 \%$. Hence, a pound would have been reduced

[^0]in value by nearly a half over this period. The table shows its value as 50.7 (pence) in 1978. In other words, $£ 1$ in 1978 would buy the same bundle of goods and services as 50.7 pence would have bought in January $1974 .^{7}$

Conversely, in 1943 the price index was 24.8 (ie prices were around a quarter of the January 1974 level). Hence, a pound in 1943 was worth roughly four times a pound in 1974. The table shows its value as 403.1 (pence) in 1943. In other words, $£ 1$ in 1943 would buy the same bundle of goods and services as 403.1 pence in January 1974.

The third column shows the annual percentage change in the price index (ie the inflation rate).

## Tables 2 and 3 (pages 20-21)

Tables 2 and 3 are conceptually similar to the middle column of Table 1. Table 1 allows comparisons between January 1974 and any year between 1750 and 2005. Tables 2 and 3 allow both the years in the comparison to vary. They are both produced using the same methodology. Table 2 contains data at twenty year intervals: 1755, 1775 and so on. Table 3 contains data for each year from 1987.

These tables can best be explained by use of an example from Table 2. If we look at the column headed 1955 and the row 1855, the value is 409 . From Table 1, we know the price index for 1855 is 10.5 while for 1955 it is 43.1 . In other words, prices have increased by around four times over this period. Hence a pound in 1855 was worth roughly four times a pound in 1955 due to the increase in prices over this period. Conversely, if we consider the 1975 row, the figure is 32 . The price index for 1975 is 134.8, indicating that prices are around three times higher than in 1955. A pound in 1975 is thus worth the same as 32 pence in 1955 (ie the pound lost around two thirds of its value due to inflation between 1955 and 1975).

When prices are increasing, the values in the columns will fall as you read downwards, showing the decreasing value of the pound over time. When prices are falling, the values will increase as the purchasing power of the pound increases.

## Charts

Chart 1 (page 17) plots the price index for the period 1750 to 2005 . Although such a graph illustrates the extent to which the absolute increase in prices has been concentrated in recent years, it over-emphasises the proportional impact. For example, in chart 1 a doubling of the price index in the eighteenth century from, say, 5 to 10 appears to be much less significant than a doubling in the 1970s from 100 to 200. Such problems can be overcome by use of a logarithmic scale as in Chart 2 (page 18). With a logarithmic scale, equal proportional increases produce the same vertical change whatever the initial value. Charts 3 and 4 (pages 18 and 19) plot the value of the pound

[^1]on linear and logarithmic scales respectively. Chart 5 (page 19) plots the rate of inflation in each year.

## Results

Over the period as a whole, prices have risen nearly 150 -fold. Thus one (decimal) penny in 1750 would have had greater purchasing power than a pound in 2005.

Although there was considerable year-on-year fluctuation in price levels prior to 1914 (reflecting the quality of the harvest, wars, etc) there was not the long-term steady increase in prices associated with the period since 1945. Prices in 1914 were roughly twice their level in 1750 but were below the level of the early nineteenth century. Prices doubled during the First World War but in most years between 1921 and 1938 they fell or showed very small increases. Although prices began to rise during the Second World War, the increase was less marked than during the First World War. Since 1945 prices have risen in every year: prices were nearly 29 times higher in 2005 compared to 1945. In the period 1974 to 1981, inflation was above $10 \%$ in each year except 1978, and prices more than tripled in these eight years. Despite lower inflation rates in the late 1980s and early 1990s, and very low (by post-war standards) rates in recent years, prices still rose by over $50 \%$ between 1990 and 2005.

## IV Specimen calculations

The examples below illustrate how the price index in Table 1 can be used to answer frequently asked questions.

## Example 1:

How much would have been needed in 2005 to have the same purchasing power as £100 in 1850?

From Table 1 the price index for 1850 was 8.4 and the index for 2005 was 757.3. In 2005 the average price level was 90.2 times (757.3/8.4) the 1850 level. Thus, to have the same purchasing power as $£ 100$ in 1850 one would have needed some $£ 9,020$ (90.2 $x £ 100$ ) in 2005.

## Example 2:

What was the purchasing power of a pound in 2005 compared to the pound in $1930 ?$
From Table 1 the price index for 1930 was 17.3 and the index for 2005 was 757.3. In 2005 the average price level was some 43.8 times (757.3/17.3) the 1930 level. Thus, relative to 1930, a pound in 2005 was worth around 2.3 (decimal) pence ( $100 \mathrm{p} / 43.8$ ).

## Example 3:

Cheddar cheese cost 17 pence per kilogram in 1923 and $£ 5.63$ per kilogram in $2005 .{ }^{8}$ How did the price change in real terms?

From Table 1 the price index for 1923 was 18.7 and the index for 2005 was 757.3 . In 2005 the average price level was 40.5 times $(757.3 / 18.7)$ the 1923 level. Over the same period the price of cheese rose 33.1 times (563/17). Thus, in real terms, the price has fallen by 18.3\% [((33.1/40.5)-1) x100].

[^0]:    1 There are other price indices besides the RPI. For example, the Consumer Prices Index (CPI) is now the measure used for the Bank of England's inflation target.
    2 The all-items RPI is published by ONS monthly and is available on their website at: www.statistics.gov.uk/statbase/Product.asp?vInk=9412
    3 Source: C H Feinstein, National Income, Expenditure and Output of the United Kingdom 1855 to 1965, 1972, tables 24 and 25.
    4 Source: W Layton and G Crowther, An Introduction to the Study of Prices, 1935, table 1
    5 Source: E H Phelps-Brown and S Hopkins, "Seven Centuries of the Prices of Consumables compared with Builders' Wage-rates", Economica, November 1956, pp296-314
    61974 was chosen as the base year largely on the pragmatic grounds that as well as being one of the link years in the series, its use prevents the data at the start and end of the period being inconveniently large or small.

[^1]:    7 The purchasing power of the pound column is calculated as 100 multiplied by $100 /$ (price index [column 1]) for the relevant year.
